

AvEn – Available Energy

Know the real MWh of your BESS.

Cell imbalances and conservative limits of the BMS (Battery Management System) silently hold back up to 10% of your dispatchable energy. AvEn quantifies the tradable energy of utility-scale storage as a deterministic, high-frequency signal, integrated into the systems you already run.

Reduce risk. Recover revenue.

- Trade confidently on true dispatchable capacity.
- Avoid non-delivery risk and costly buybacks.
- Recover trapped revenue, ROI guaranteed.

Your Asset. Your Data. Your Dispatch.

BATTERY PICTURE**

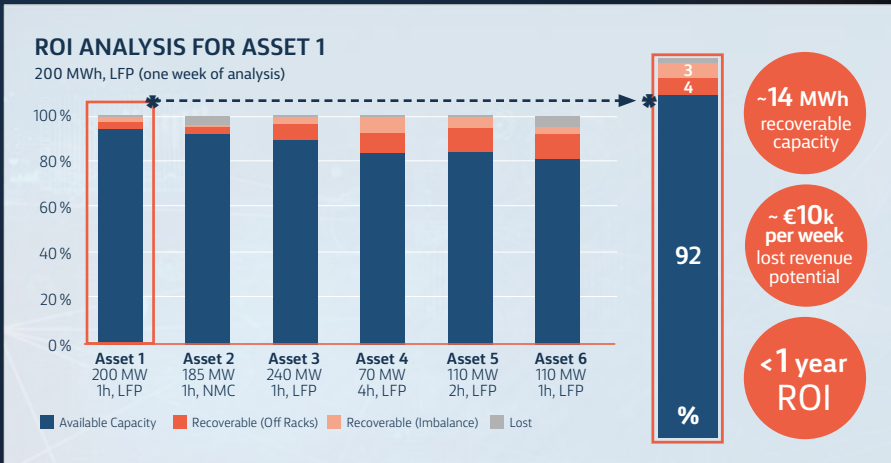

Recoverable Capacity

Up to €500,000 annual revenue potential

Recoverable capacity is energy that's physically there but not tradable: blocked by imbalances, BMS limitations or offline racks, and recoverable through targeted maintenance.

2026 FIELD DATA FROM 6 UTILITY-SCALE ASSETS

- Available, recoverable, and finally bankable.
- High-frequency API signals, integrated into your SCADA, Energy Management System (EMS), Asset Performance Management (APM) and trading systems.
